

## **Project Design Phase-II**

### **Technology Stack (Architecture & Stack)**

Date	22-Oct-2022
Team ID	PNT2022TMID04647
Project Name	IoT Based Smart Crop Protection System for Agriculture.

#### **Technical Architecture:**

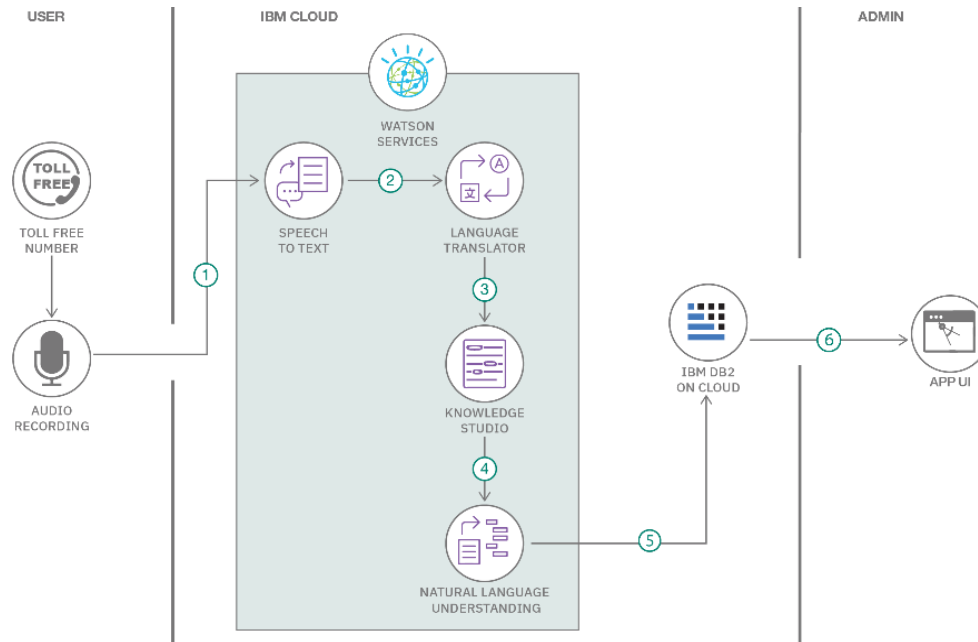

The Deliverable shall include the architectural diagram as below and the information as per the table1 & table 2

#### **Example: Order processing during pandemics for offline mode**

#### **Guidelines:**

- 1.The animals and birds which destroy the crop, so this will help to protect the crops from destroy. This system also helps farmers to monitor the soil moisture levels in the field and also the temperature and humidity values near the field. The system will also help to control the irrigation system. Ex. Themotors and sprinklers in the field can be controlled using the mobile application.
- 2.The temperature and humidity in the field are tracked from a web app using weather API and update automatically.
- 3.Based on weather change the motors and sprinklers in the field can be controlled using the mobile application.
- 4.The sensors detect the temperature and humidity values near the field.

5.Attack of birds and animals can be detected by sensors through mobile applications.

**Table-1 : Components & Technologies:**

S.No	Component	Description	Technology
1.	User Interface	Mobile application is the user interface.	HTML, CSS, JavaScript etc.

2.	Application Logic-1	Protect the crops from animal and bird attacks.	Java / Python
3.	Application Logic-2	Helps farmers to monitor the moisture levels in the field.	IBM Watson STT service
4.	Application Logic-3	Motors and sprinklers in the field can be controlled using the mobile application.	IBM Watson Assistant
5.	Database	Data Type, Configurations etc.	MySQL, NoSQL, etc.
6.	Cloud Database	Database Service on Cloud	IBM DB2, IBM Cloudant etc.
7.	File Storage	Informations such as temperature, humidity about the fields.	IBM Block Storage or Other Storage Service or Local Filesystem
8.	External API-1	Aim is to provide the activities of field to farmers.	IBM Weather API, etc.
9.	External API-2	Farmers can easily access everything about their field from home.	Aadhar API, etc.
10.	Machine Learning Model	Purpose is to produce high yield of crops.	Object Recognition Model, etc.
11.	Infrastructure (Server / Cloud)	Application Deployment on Local System / Cloud Local Server Configuration: Cloud Server Configuration : Ibm cloud.	Local, Cloud Foundry, Kubernetes, etc.

**Table-2: Application Characteristics:**

<b>S.No</b>	<b>Characteristics</b>	<b>Description</b>	<b>Technology</b>
1.	Open-Source Frameworks	ThingsBoard.	Technology of Opensource framework
2.	Security Implementations	By using IoT devices , the fields will be safe.	e.g. SHA-256, Encryptions, IAM Controls, OWASP etc.
3.	Scalable Architecture	3 – tier, Micro-services	Technology used
4.	Availability	use of load balancers, distributed servers .	Technology used
5.	Performance	There will be less work for farmers and the entire field is controlled using IoT devices.	Technology used
